PREMANT-project Longchamp, Paris 2016

Case Study

Project

BRUGG Tubes SAS (France) was able to add another particularly prestigious project to its portfolio. This was a joint project with Bouygues SA and involved the famous Longchamp horse racecourse in Paris (Hippodrome de Longchamp). The renowned racecourse was built in 1857 on the walls of the Abbey of Longchamp, which was destroyed during the French Revolution, and was inaugurated by Napoleon III. The racecourse hosts the annual Grand Prix de Paris.

Bouygues is the fifth-largest construction company in Europe and has its headquarters in Paris. The project involved a two-year framework contract. It involves a district heating network, as well as a cooling network, both 1500 m long. BRUGG Tubes SAS calculated the statics, while laying company STM carried out the welding work. At this site, the customer imposed special delivery requirements on us.

To ensure that the pipes could be unloaded comfortably and due to safety regulations on the building site (pipe storage on-site, see photo 1), a timber had to be inserted between each row of pipes, which is also used for storage. The trucks had to be opened from the top to guarantee speedy unloading. BRUGG Tubes SAS and the installer were able to meet these requirements. The trenches were extremely generous, which worked in their favour as they were able to carry out the work on the sleeves and the welding work quickly and without complications.
